Description

Combiner Box - 5 Way for Solar Systems

The combiner box is a device that combines the output of multiple strings of PV modules for connection to the inverter. It is typically used in the larger commercial and utility scale PV power plants. The combiner box commonly houses the input overcurrent protection fuse assemblies for several strings (from as few as three strings to as many as 52), as well as the combined bus of those inputs into a single main output.
